Teamwork Makes the "Therm" Work!

Scaling District Geothermal through Coalitions

Geothermal: The Genius Renewable

Live at Groundwater Week in partnership with NGWA

Las Vegas, NV
December 5-7, 2023
CEUs for this workshop

Be sure to scan the QR for Tuesday, Wednesday, and Thursday workshops to get points towards your IGSHPA certification CEUs.

Important Places to Check Out!

2023 Conference Survey

We would like to get your feedback on future conferences. Please use the QR code to the right (for your laptop/desktop, go to https://igshpa.org/2023conference/survey to complete a survey to let us know your preferences and suggestions). Thank you for helping us build the groundwork for sustainability!

Annual Conference, December 5 - 7, 2023 – Las Vegas, NV
Learning Objectives

• Contrast ground source, geothermal, community heat pumps, networked geothermal, district geothermal, and Thermal Energy Networks

• Define the characteristics that make a building or neighborhood a promising fit for GSHP implementation

• Analyze the challenges of crossing industry boundaries in order to create effective coalitions, and utilize case studies to create coalitions to scale district geothermal

• Leverage funding opportunities to launch a pilot project
We NEED Scale to Solve the Climate Emergency

Developing Thermal Energy Networks (TENs) is rapidly emerging as a key approach to scaling building decarbonization, moving away from a “building-by-building” and toward a “community-by-community” or “neighborhood-by-neighborhood” approach.
Forming a Coalition

Community Voice
Understand and communicate needs of the community

Analysis & Design
Model and design geothermal district heating/cooling system

Deployment
Obtain permits and build

Workforce
Develop and implement training/apprenticeships

image credit: U.S. Dept. of Energy, Geothermal Technology Office
Coalition Members May Include

• State and Local Regulators
• Policymakers and Other Officials
• Other Governmental Bodies (City, County, State)
• Economic and Industrial Development Agencies and Organizations
• Public and Private Regulated Utilities
• Activist or Community Based Organizations
• Housing Organizations
• Commercial Developers
• Solution Providers and Manufacturers
• Trade Unions
• Trade Organizations
Next Steps in Your Community

1. **Engage a Thermal Development Team**
2. **Identify Coalition Members, Structure and Form the Coalition**
3. **Develop a Thermal Access Agreement and Authorize the Coalition to Perform**
4. Identify thermal supply sources and thermal supply deals
5. Identify and Secure a Project Pipeline through Customer Acquisition
6. Identify and Procure EPC, Maintenance and Billing Partners
7. Finance and Construct Thermal Nodes and Connections
8. Identify and Secure Partners for conveyance if applicable
A New Utility is Born
Heat pump sales in U.S. surged past gas furnaces in 2022

2022 figures include sales data for Jan–Nov and projected sales for Dec.

Chart: Canary Media • Source: Air-Conditioning, Heating, and Refrigeration Institute • Embed • Download image

This is part of our special series "Home of the Future." Read more.

Chart: Americans bought more heat pumps than gas furnaces last year

Even before Inflation Reduction Act incentives kicked in, Americans bought more heat pumps than ever before last year — well over 4 million.
Fleeing Customers, Increasing Gas Bills
Networked Geothermal (AKA Thermal Energy Networks)

- Ground source heat pumps
- “Shallow” boreholes
- Ambient temperature
- Single pipe
- Thermal management
Sharing Energy

Utility Interest

As of Sept. 11, 2023

Gas Utility Pilots
Utility NetGeo Coalition
Networked Geothermal Pilot
Eversource operates across three states and has been recognized by Barron’s as the most sustainable energy company in the nation.

- Approximately 4.4 million total energy customers across the three states (Gas, Electric, and Water)
- Internally set a net zero by 2030 goal
- Working towards broader climate goals in each of the operating states
Project Overview

- Loop is currently being installed in Framingham, MA
- Single pipe design with approximately 1 mile of main
- ~375 ton system
- 24 Residential Homes, 5 Commercial Buildings, 10 FHA Apartment Buildings
- Main borefield with smaller satellite fields
- Combination of all heating types
### Big Picture Questions

- Is it feasible to provide geothermal wells/loops and GSHPs as an **alternative/complement to delivered fossil fuels and gas service**?
- What is the **appropriate financial and business model**?
- What are the **customer energy and cost savings**?
- What is **required to maintain a GSHP system of wells**?
- What are the **efficiencies that can be gained from shared loop system**?
Site Selection Process

- 17 originally screened sites across 5 cities
- Three phase screening used. Two quantitative with the third being detailed route selection (qualitative)
- Initial criteria were go/no go with critical site attributes as per the D.P.U order
- Screening 2 was quantitative with scoring assigned to a set of 24 criteria
- Some of the factors analyzed:
  - Load Diversity
  - Customer Fuel Diversity
  - Area Geology (Depth to Bedrock)
  - ROW Accessibility
  - Potential MEP sites
Building conversions are a critical part of connecting customers to a networked geothermal loop
Depending on the existing systems, it can be challenging
Dual systems could be installed for reliability or cost savings
Electric baseboard systems generally have the highest ROI for customers
Energy efficiency work is also being completed with HVAC installations
Opportunities for NY Sites

- Lots of dense, diverse load in urban centers
- EJ communities make strong loop anchors
- Green space can be used to site borefields
- Strong state-level push for thermal networks
  - Thermal Energy Network and Jobs Act
- Multiple announced demonstration projects
- New building projects already taking advantage of GSHP
Integration With Alternative Sources

- NYC especially has diverse heating and cooling sources that can be tied into a thermal network
  - Waste Heat Recovery
  - Power Plants
  - Data Centers
  - Rivers, Oceans, etc.
  - Refrigeration, labs, universities
## Project Success Metrics

| Validated installation and operating costs    | • System installation costs  
|                                                | • Ongoing O&M costs                                         |
| Customer acceptance of technology             | • Customer Satisfaction surveys  
|                                                | • Customer comfort                                          |
| Environmental Benefits                        | • Emission reductions  
|                                                | • System efficiency                                         |
| Technology performance                        | • System performance  
|                                                | • Changes in customer energy consumption                     |
| Cost savings                                  | • Changes in customer heating and cooling costs             |
WE LEAD WITH OUR INTELLECTUAL CAPITAL AND TECHNICAL EXPERTISE

WE INVEST OUR FINANCIAL CAPITAL TO TRANSITION YOUR BUILDINGS TO CLEAN ENERGY

We provide building owners with immediate cost savings and revenue potential without the need for any capital investment.
The ability to "pre-heat" or "pre-cool" the system from the earth's 55-degree ambient temperature dramatically reduces system demand compared to conditioning peak outside air temperatures.

Geothermal solutions provide efficiencies more than 400%, while traditional fossil fuel systems are limited to 78-90%.
**Geothermal System Design Elements**

**Building System (HVAC):**
Water Source Heat Pumps, Interior Piping, Circulating Pumps, DHW Heating Equipment, etc.

**Ground Connection (GLHE):**
Ground heat exchanger (sub-surface lateral piping, and the manifold / header)
Coordination with MEP to best understand building loads

Evaluate temperature requirements for air or water heat distribution
Water-to-water and water-to-air heat pumps leverage the ambient temperature loop to provide the most efficient heating and cooling.

Buildings with opposing loads can benefit from each other’s energy use when connected to an ambient temperature network.

Ambient temperature loops can also source energy from closed-loop geothermal, waste-water heat recovery, CSO, and surface water.

AMBIENT LOOP CASE STUDY
BARRY FARMS COMMUNITY HEAT PUMP PILOT

- An affordable housing re-development project in Southeast Washington.
- Awarded $2.5 Million from the Washington D.C. Public Service Commission to support the pilot project.
- The community heat pump will connect a multi-use, multifamily building to townhomes.
- First phase of geothermal system will be serving 200 apartments and commercial areas.
- Project brings clean heat in a historic and environmental justice neighborhood.
This area has many obstacles that would prevent conventional geothermal drilling methods from being installed:

- Trees
- Narrow Street
- Underground utilities
- Sensitive research buildings nearby
There's available drilling technology that is capable of drilling at very precise, straight inclined angles.

These inclined boreholes can be drilled in a small surface area and extend to contact an overall greater thermal mass.

Boreholes can extend from the drilling area to the building or property footprint boundaries.
**ENERGY RESULTS**

**SYSTEM PERFORMANCE**

Outdoor air temperature and temperature to and from BTES over one year for Frölundatorg.

Daily COP and outside air temperature for Frölundatorg with a yearly average COP 4.7.
COST FEASIBILITY WITH INCENTIVES & FINANCING

INCENTIVES: LOWERING COSTS AND FUTURE PENALTIES

- The federal investment tax credit applies to both the ground technology and building mechanical equipment
- State and local district heating and cooling opportunities
- Avoided cost of local govt penalties

FINANCING: SUPPORTING UPFRONT OR LONG-TERM PAYMENT

- State or city financing tools and loans
- Private and utility “As a Service” funding models
